FUNCTION SPECIFICATION

1 Command

Refer to the Technical Manual for the SSD1306 – Revision 1.2

2 Power Down and Power up Sequence

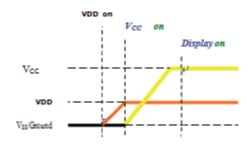

To protect OEL panel and extend the panel life time, the driver IC power up/down routine should include a delay period between high voltage and low voltage power sources during turn on/off. It gives the OEL panel enough time to complete the action of charge and discharge before/after the operation.

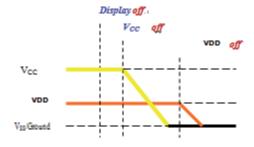

Power up Sequence

- 1. Power up VDD
- 2. Send Display off Command
- 3. Initialization
- 4. Clear Screen
- 5. Power up Vcc
- 6. Delay 100ms (When VDD is stable)
- 7. Send Display on Command

Power down Sequence

- 1. Send Display off command
- 2. Power down Vcc
- 3. Delay 100ms (When Vcc is reach 0 and panel is completely discharges)
- 4. Power down VDD

- 3. Normal segment and display data column and row address mapping (SEG0 mapped to column address 00h and COM0 mapped to row address 00h)
- 4. Shift register data clear in serial interface
- 5. Display start line is set at display RAM address 0
- 6. Column address counter is set at 0
- 7. Normal scan direction of the COM outputs
